Drug Abuse in the Newark Primary Metropolitan Area

Abate Mammo, Ph.D.

ABSTRACT

In this report we present drug abuse indicators in the Newark primary metropolitan statistical area (Newark PMSA) using substance abuse treatment data, ED data, ME cases, and others. Most primary treatment admissions (89.6 percent) in the first half of 2002 (1H2002) were illicit-drug related. Heroin accounted for 63.8 percent of primary treatment admissions in Newark PMSA, compared with 7.6 percent for crack/cocaine and 7.6 percent for marijuana. Heroin use as a primary, secondary, or tertiary drug accounted for 67.3 percent in the 1H2002 compared with 67.7 percent in 2001. Consistent with treatment data, ED heroin mentions in the Newark PMSA accounted for the largest proportion of drug mentions (36.3 percent in 1H2002). Although only 7.6 percent of treatment admissions in 1H2002 reported cocaine/crack as their primary drug of abuse, it accounted for 41.0 percent of primary, secondary, or tertiary drug treatment admissions and 32.2 percent of ED mentions in the 1H2002. Between 2000 and 2001, heroin purity declined from 72.2 percent to 68.5 percent while its price was stable at 33 cents per milligram pure. Most of the heroin sold in the Newark PMSA came from South America. Despite the high purity of heroin sold in the PMSA, heroin injection among 18-25 year old treatment admissions increased from 40.8 percent in 1H2001 to 50.4 percent in 1H2002. There were 304 drugrelated deaths in 2001 in the Newark PMSA compared with 250 in 2000. Cocaine- and heroinrelated deaths are still in Newark PMSA. However, the continued rise in drug-related mortality was driven by the sharp increase in narcotics analgesics and marijuana deaths.

INTRODUCTION

Area Description

The Newark primary metropolitan statistical area (Newark PMSA) consists of five counties (Essex, Morris, Sussex, Union, Warren). In 2000, there were 2,032,989 residents in the PMSA with 39 percent living in Essex County (that contains Newark City), 26 percent in Union County, 23 percent in Morris County and the rest residing in the two other counties. The population of Newark PMSA is diverse in its race distribution with 66 percent White, 23 percent Black, 4 percent Asian. Hispanics accounted

for 13 percent of the PMSA population in 2000. There is also a wide variation in race/ethnic distribution the PMSA within each county. In Essex County, 45 percent of the population is White and 41 percent Black. Union County is 65 percent White and 21 percent Black. By comparison, Morris is 87 percent White and 3 percent Black, Sussex is 96 percent White and 1 percent Black, and Warren is 95 percent White and 2 percent Black. Hispanics accounted for 15 percent in Essex, 7 percent in Morris, 3 percent in Sussex, 19 percent in Union and 4 percent in Warren. The counties are also very diverse by socio-economic status. In the Newark PMSA, 5.8 percent of families with children under 18 live below the poverty level. For counties within the PMSA, the poverty status for families with children under 18 was 18 percent in Essex, 3 percent in Morris, 4 percent in Sussex, 9 percent in Union and 5 percent in Warren. The social, demographic and economic variations suggest substantial differences in drug use behaviors of residents by county.

Data Sources

This report uses data from various sources, as indicated below.

- Drug treatment data were obtained from the Alcohol and Drug Abuse Data System (ADADS), a statewide, episode-based data system operated by the Division of Addiction Services of the Department of Health and Senior Services. The data include demographic information, drug use history, and detailed information on the three most abused drugs at the time of admission. ADADS has been operating since July 1, 1991, and contains more than 780,000 admission and discharge records. Treatment information obtained from ADADS includes all statistics for Newark City, the Newark PMSA, and the State. This report uses treatment data primarily from the first half of 2002. Major drug treatment admissions for the Newark PMSA are along with statewide data. In addition, data from the Client Oriented Data Program dating from 1985 to the first half of 1991 are used to study historical trends in heroin injection in Newark PMSA and the state.
- Emergency department (ED) drug mentions data were obtained from the February 2002 issue entitled "Emergency Department Trends

1

From the Drug Abuse Warning Network, Preliminary Estimates January–June 2002" The Office of Applied Studies (OAS) of the Substance Abuse and Mental Health Services Administration (SAMHSA) compiled the Drug Abuse Warning Network (DAWN) data. The DAWN system collected data on ED cases in the Newark PMSA (i.e., in Essex, Morris, Sussex, Union and Warren Counties).

- Mortality data were obtained from the SAMHSA January 2002 report entitled "Mortality Data From the Drug Abuse Warning Network 2001." The DAWN system compiled data for counties in the Newark PMSA. Additional mortality data were obtained from the State Medical Examiner (ME) office. The DAWN system covered 60 percent of the five metropolitan statistical area (MSA) jurisdictions and 88 percent of the MSA population in 2001.
- Heroin purity and price data were obtained from the Intelligence Division, Office of Domestic Intelligence, Domestic Strategic Unit, Drug Enforcement Administration (DEA). The Intelligence Division of DEA collects data every quarter for the Domestic Monitor Program (DMP) from 23 U.S. metropolitan areas on the purity, retail price, and origin of heroin by purchasing it through undercover operations.
- Human immunodeficiency virus (HIV) and acquired immunodeficiency syndrome (AIDS) data were obtained from the statewide AIDS Registry maintained by the New Jersey Department of Health and Senior Services, Division of AIDS Prevention and Control, HIV/AIDS Surveillance Program. Data compiled as of June 30, 2002, are used in this report.

DRUG ABUSE PATTERNS AND TRENDS

General Patterns

Contrary to previous reports that focused on Newark City, drug abuse indicators for Newark PMSA are presented here for consistency with DAWN and other CEWG reports. Since Newark PMSA exhibits patterns of drug abuse that are usually unique from the rest of the State, and because the State is diverse in many ways, comparative indicator data are also presented for each when appropriate to exhibit drug abuse variations.

Exhibit 1 shows overall changes in selected indicators for specific drug types between the first half of 1H2001 and the first half of 1H2002.

In Newark PMSA, alcohol-in-combination treatment admissions accounted for 8.5 percent of all treatment admissions (exhibit 2). By comparison, ED alcohol-in-combination mentions accounted for 19.6 percent in 1H2002, while ME cases accounted for 13.7 percent in 2001.

Heroin was the most prominent drug of abuse in the Newark PMSA. In 1H2002, primary heroin treatment admissions accounted for 63.8 percent of all treatment admissions in the Newark PMSA compared with 63.6 percent in 1H2001. Statewide, primary heroin treatment admissions appear to have stabilized (46.6 percent in 1H2001 vs. 46 percent in 1H2002). More importantly, ED heroin mentions in Newark PMSA declined from 108 per 100,000 population in 1H2001 to 103 per 100,000 population in 1H2002. The number of heroin ED mentions also decreased, from 1,849 in the first half of 2001 to 1,792 in the first half of 2002. Consistent with treatment data and ED data, ME heroin-related mentions dropped from 179 mentions in 2000 to 177 mentions in 2001.

Primary cocaine/crack abuse accounted for only 7.6 percent of all treatment admissions in the first half of 2002, the same as in 1H2001. However, ED cocaine mentions increased by 20 percent (from 1,327 to 1,589) in the same time period. Consistent with ED data, cocaine-related deaths increased by 8.0 percent (from 137 to 148) in the Newark PMSA between 2000 and 2001.

In the first half of 2002, primary marijuana use accounted for 7.3 percent of all treatment admissions in Newark PMSA, up from 6.9 percent in 1H2001 (exhibits 2 and 3). Consistent with its primary use, marijuana as a primary, secondary, or tertiary drug also increased to 19.4 percent of treatment admissions in the first half of 2002, compared with 17.9 percent in 2001. Consistent with the increase in treatment data, ED marijuana mentions in the Newark PMSA were 39.5 percent higher in 1H2002 than in 1H2001 (from 309 to 431). The increase in ED marijuana mentions is consistent with the 271 percent rise in ME marijuana mentions.

Phencyclidine (PCP) and other hallucinogens were rarely reported in the Newark PMSA. Among treatment admissions, there were only 4 primary PCP admissions in 1H2001, compared with 7 in 1H2002. PCP mentions as primary, secondary or tertiary drug accounted for 19 mentions in 1H2002 and for 17 percent in 1H2001. By comparison, there were 18 ED PCP mentions in 1H2001 and none in the first half of 2002. There were no other hallucinogens mentions reported in the first halves of 2001 and 2002.

Methamphetamine use was rare among treatment admissions in the Newark PMSA, with only 6 admissions reported in 1H2002 and 28 primary, secondary or tertiary admissions reported in the first half of 2002. There was no ED methamphetamine mention in the first half of 2002.

Club drugs, such as methylenedioxymethamphetamine (MDMA or ecstasy), gamma hydroxybutyrate (GHB), and Ketamine, were rarely reported by clients in the Newark PMSA. While still rare, there were 21 ED ecstacy mentions in the first half of 2002, compared with 18 in 1H2001. By comparison, in 1H2002, there were 3 primary ecstacy treatment admissions and 16 primary, secondary, or tertiary ecstacy admissions in 1H2002.

Overall, substance abuse treatment admissions in the Newark PMSA increased between 1H2001 and 1H2002, with most of the increase driven by alcoholin-combination and marijuana abuse.

Newark PMSA has the largest number of illicit drug abusers per capita compared with other parts of the State, yet needs assessment studies indicate that only a small percentage were in treatment. It was estimated that there were 38,404 heroin abusers and 15,046 cocaine abusers in Newark PMSA in 2000. However, only about 8 percent of those with primary heroin abuse and about 5 percent of those with primary cocaine abuse problems received treatment in 2000.

Statewide, the proportionate share of heroin treatment in 1H2001 admissions grew marginally from 46.6 percent to 48.0 percent in 1H2001 and 1H2002, respectively. By comparison, primary crack/cocaine, marijuana and alcohol-in-combination admissions were stable in the same time period.

The 2001 survey of middle school students suggested a substantial decrease among students in the use of alcohol, marijuana, inhalants, hallucinogens, cocaine, and heroin. The survey showed that 2.4 percent of students in grades 7 and 8 had used club drugs in their lifetime. Lifetime use of any illicit drug declined from 20.7 percent in 1999 to 15.6 percent in 2001.

In the first half of 2002, 26.9 percent of primary heroin treatment admissions in Newark PMSA injected the drug (exhibit 2). Heroin injection among 18–25-year-old treatment admissions continued to increase, from 41.7 percent in 2001 to 50.4 percent in the first half of 2001 (exhibit 4). Statewide, injection by 18–25-year-old clients increased from 53.4 percent in 2001 to 56.0 percent in the first half of 2002 (exhibit 5). In 1H2002, heroin injection by

clients age 18–25 was highest among Asian/Pacific Islanders (52.0 percent) followed by Whites (47.9 percent), Hispanics (44.7 percent) and Blacks (11.8 percent).

During the period in which heroin injection continued to increase, its purity declined modestly between 2000 and 2001. Heroin purity in the Newark PMSA was 68.5 percent in 2001, down from 72.2 percent in 2000 and was the second highest after Philadelphia among the DAWN cities.

Consistent with the high prevalence of heroin injection, 330 percent of the people living with HIV/AIDS as of June 30, 2002 were exposed to the disease because of injection drug use. People living with HIV/AIDS were predominantly Black (72 percent) or Hispanic (14 percent) (exhibit 7). Statewide, IDU accounted for 34 percent of those living with HIV/AIDS (exhibit 7).

The total number of drug-related deaths in the Newark PMSA increased from 250 in 2000 to 304 in 2001. Seventy-four percent of the decedents I 2001 were male, with Blacks and Whites accounting for 48.4 and 38.5 percent of the ME drug-related deaths, respectively. Most of the decedents (87.5 percent) were older than 25, with 64.5 percent being age 35 or older.

Arrests for the sale and manufacture of drugs in the Newark PMSA increased from 5,449 in 2000 to 7,008 in 2001. By comparison, arrests for drug possession and use declined from 12,716 in 2000 to 11,260 in 2001. Most of those arrested for sale and manufacture (87.1 percent) and 55.0 percent of those arrested for possession and sale in 2001 lived in Essex County, where Newark City is located. Statewide, arrest patterns were similar to patterns in the Newark PMSA.

Patterns of Drug Use by Drug Type

Cocaine and Crack

Primary cocaine/crack treatment admissions in Newark accounted for 7.6 percent of treatment admissions (5.2 percent for crack cocaine and 2.4 percent for powder cocaine) in the first half of 2002 (exhibit 2). In 1H2001, 4.9 percent of treatment admissions were primary crack abusers and 2.7 percent were powder cocaine abusers, for a total of 7.6 percent suggesting stability in crack/cocaine abuse in the Newark PMSA. Despite cocaine's small share as a primary drug among treatment admissions, it remained popular as a secondary drug for heroin clients in Newark PMSA. Consistent with Newark

PMSA data, cocaine abuse as a primary drug in the State was also stable between 1H2001 and 1H2002 (10.3 percent in 1H2001 vs. 10.6 percent in 1H2002). In the 1H2002, cocaine abuse as a primary, secondary or tertiary drug accounted for 40 percent of all drug abuse mentions in the State.

In the first half of 2002, males accounted for 65.6 percent of powder cocaine admissions and 49.4 percent of crack cocaine admissions in the Newark PMSA (exhibit 2). The majority (82.4 percent) of powder cocaine admissions in Newark PMSA were older than 25; 61.4 percent of crack cocaine and 51.6 percent of powder cocaine admissions were at least 35 years old.

Over two-thirds (68.2 percent) of cocaine/crack admissions in the Newark PMSA smoked the drug, while 28.7 percent used it intranasally in the first half of 2002. By comparison, 2.6 percent of primary treatment admissions injected cocaine/crack in the 1H2002 (exhibit 2).

Cocaine/crack use varied by race/ethnicity in Newark PMSA. In the first half of 2002, 69.0 percent of crack cocaine admissions were Black, 24.1 percent were White and 5.9 percent were Hispanic. By comparison, 40.7 percent of powder cocaine admissions were Black, 38.9 percent were White and 18.1 percent were Hispanic (exhibit 3).

Cocaine as a primary, secondary, or tertiary drug among treatment admissions in the Newark PMSA increased from 38.0 percent in 2001 to 41.3 percent in 1H2002. ED data also suggest an increase in cocaine mentions by 19.7 percent (from 1,327 in 1H2001 to 1,589 in 1H2002) with the rate of cocaine mentions per 100,000 population rising from 77 to 91.

Cocaine-related deaths increased from 137 in 2000 to 148 in 2001. The increase in cocaine-related deaths in the Newark PMSA was consistent with the marginal increase in cocaine treatment mentions and ED cocaine mentions.

Cocaine prices have been remarkably stable over the years selling for \$5–\$30 per bag in the Newark PMSA in the first quarter of 2001. No 2002 price data are available to report at this time.

Heroin

In Newark PMSA, there were 5,777 primary heroin treatment admissions in the first half of 2002 (exhibit 2), compared with 5,523 in the first half of 2001, suggesting a marginal increase in the number of

primary heroin admissions. The relative share of primary heroin admissions, however, was stable between 1H2001 (63.6 percent) and 1H2002 (63.5 percent).

In the first half of 2002, males accounted for 62.4 percent of heroin admissions in the Newark PMSA. There is variation by race/ethnicity in heroin admissions with Blacks accounting for 57.0 percent, Whites for 27.1 percent, and Hispanics for 14.2 percent of heroin treatment admissions. Almost 90 percent (88.8 percent) of primary heroin admissions were older than 25, with 58.4 percent age 35 or older.

Heroin abuse as a primary, secondary, or tertiary drug accounted for 67.3 percent in the Newark PMSA. Its share appears to have stabilized between 2001 and 1H2002.

In the first half of 2002, 26.9 percent of treatment clients injected heroin compared with 24.6 in 1H2001. The increase in heroin injection between 1H2001 and 1H2002 in the Newark PMSA (exhibit 4) is also consistent with the continued statewide rise in heroin injection (exhibit 5). Heroin smoking remains very rare in the Newark PMSA, with less than 1 percent (.9 percent) of primary treatment admissions reporting this route of administration (exhibit 2).

Both in the Newark PMSA and the State, the rise in heroin injection was most pronounced for 18–25-year-olds while injection by 26-34 years old clients has been also rising moderately (exhibits 4 & 5).

While heroin ED mentions accounted for the largest number of drug mentions reported, its relative share declined to 36.3 in 1H2002 from 40.0 percent in 1H2001. Consistent with heroin treatment data and ED heroin mentions, the rate of heroin ED mentions declined from 108 per 100,000 population in 1H2001 to 103 per 100,000 population in 1H2002.

Heroin purity is still very high but fluctuating in the Newark PMSA. In 2001, heroin purity was estimated at 68.5 percent per pure milligram. In 2000, heroin was 72.2 percent pure. The price per milligram of heroin appears to have stabilized at \$0.33 both in 2000 and 2001. The Newark PMSA has the second highest heroin purity (after Philadelphia) coupled with the lowest price among the 21 DAWN cities. According to the DEA report, almost all the heroin sold in the Newark PMSA is South American.

In 2001, ME data show 177 heroin mentions in the Newark PMSA and was about the same in 2000 (179 heroin mentions). The stable pattern in ME heroin

mentions is consistent with the recent patterns in both treatment data and ED data.

Opiates Other than Heroin

There were 101 primary "other opiates or synthetics" (other opiates) treatment admissions in the first half of 2002 compared with 69 in 1H2001. By comparison, primary, secondary, or tertiary other opiates treatment admissions in the first half of 2002 accounted for 2.3 percent (203 mentions) in the Newark PMSA.

In the first half of 2002, there were 12 Hydrocodone/combinations mentions and 49 Oxycodone/combinations mentions in the Newark PMSA. In the first half of 2001, there were 12 Hydrocodone/combinations mentions and 49 Oxycodone/combinations mentions.

In 2001, there were 18 Oxycodone mentions among Newark PMSA ME cases up from 4 in 2000. Statewide, there were 58 Oxycodone ME mentions and 11 Hydrocodone ME mentions in 2001.

Marijuana

In the first half of 2002, marijuana accounted for 7.3 percent of primary treatment admissions in Newark PMSA (exhibit 2), which was only marginally higher than the drug's share in 1H2001 (6.9 percent).

Only 8.5 percent of primary marijuana treatment admissions were age 35 or older in the first half of 2002. Most marijuana treatment admissions (73.5 percent) were younger than 26, with 33.1 percent younger than 18. A substantial proportion (48.8 percent) of primary marijuana treatment admissions in Newark PMSA also abused alcohol as a secondary drug, and 8.5 percent abused alcohol as a tertiary drug. In 1H2002, 19.4 percent of clients reported using marijuana as their primary, secondary or tertiary drug at the time of admission.

There were 18 ED marijuana mentions per 100,000 population in 1H2001. In the first-half of 2002 ED data suggest that the rate of marijuana ED mentions in the Newark PMSA has jumped to 25 per 100,000 population. Consistent with ED mentions, ME marijuana mentions more than doubled between 2000 and 2001 (14 in 2000 and 38 in 2001).

Marijuana seizures in New Jersey increased from 1,813 in 1998 to 3,299 in 1999. There were no recent seizure data available for Newark PMSA.

Prices of marijuana were stable in the Newark PMSA. According to the DEA, marijuana sold for \$5-\$10 per bag and \$2-\$5 per joint in the first quarter of 2001. No recent price data were available for Newark PMSA to report.

Stimulants

Ecstacy use is still rare in the Newark PMSA with only 1 ED mention reported in 1H2002 and 1H2001. By comparison, there were 3 ecstacy primary treatment admissions in 1H2002 compared with 1 in 1H2001. There were 16 ecstacy abuse mentions as a primary, secondary, or tertiary drug in Newark PMSA in the first half of 2002 compared with 8 for 1H2001.

In the first half of 2002, only 6 primary methamphetamine treatment admissions were reported in the Newark PMSA. Methamphetamine use as a primary, secondary, or tertiary drug was reported only 28 times in Newark PMSA. Methamphetamine use was also rare in the State, with 121 mentions reported as a primary, secondary, or tertiary drug in the first half of 2002.

Depressants

Benzodiazepines remain the fifth most abused drugs in Newark PMSA after alcohol, heroin, cocaine, and marijuana. In the first half of 2002, benzodiazepine use as a primary, secondary, or tertiary drug accounted for 2.3 percent of treatment admissions, compared with 1.6 percent in 2001. Consistent with its lower share among treatment admissions and ED mentions (0.9 percent), 2001 ME data show that benzodiazepine mentions accounted for only 0.4 percent in the Newark PMSA.

According to the first half of 2002 DAWN data, there were only 6 GHB ED mentions in Newark PMSA and no Ketamine ED mentions. By comparison, treatment data suggest that there was no GHB abuse as a primary, secondary, or tertiary drug by clients compared with 2 mentions for Ketamine.

Hallucinogens

PCP abuse as a primary, secondary, or tertiary drug was reported 19 times in 1H2002 in the Newark PMSA. By comparison, there were only 7 primary PCP treatment admissions and 4 other hallucinogens mentions in 1H2002. There were no PCP or other hallucinogens mentions reported in the DAWN data for Newark PMSA in the first half of 2002. No hallucinogens-related deaths were reported in the

Newark PMSA in 2001 and there was only one mention in 2000.

Lysergic acid diethylamide (LSD) use remains very low in the Newark PMSA with no ED mentions reported in 1H2001 or 1H2002.

Alcohol

In Newark PMSA, the share of alcohol only treatment admissions declined from 11.4 percent to 10.4 percent between 1H2001 and 1H2002 while alcohol-in-combination admissions were stable in the same time period (exhibit 3).

Despite its continued decline, alcohol is still a major secondary or tertiary drug of abuse among crack/co-caine, heroin, and marijuana treatment clients. For example, in the first half of 2002, 42.6 percent of crack treatment admissions and 47.5 percent of powder cocaine treatment admissions, 48.8 percent of marijuana treatment admissions reported alcohol as a secondary drug in the Newark PMSA.

As expected, large proportions of alcohol-only treatment admissions (93.1 percent) and alcohol-incombination admissions (78.2 percent) were older than 25 in the first half of 2002 (exhibit 2). Alcohol-in-combination ME mentions were 11 percent higher in 2001 compared with 2000 (98 in 2000 vs. 109 in 2001), while its proportionate share among ME mentions declined from 15.7 percent in 2000 to 13.4 percent in 2001.

Tobacco

A large proportion of substance abusers are heavy cigarette smokers. Treatment data show that the proportion of clients smoking cigarettes has grown from 79.8 percent in 1H2001 to 80.8 percent in the first half of 2002 in the Newark PMSA. Statewide smoking status stayed high but stable at 77.3 percent between 1H2001 and 1H2002.

Like all other drugs, cigarette smoking in Newark PMSA varies by gender, race/ethnicity, and type of drug abused. Overall, 78.1 percent of male clients and 85.6 percent of female clients smoked cigarettes in the first half of 2002. Among male treatment admissions, heroin admissions smoked the most (86.2 percent), followed by admissions for alcohol-incombination (73.6 percent), crack (71.6 percent), marijuana (64.6 percent), cocaine (62.5 percent), and alcohol-only (59.1 percent). The percentages who smoke cigarettes among female treatment admissions were 90.6 for heroin, 79.4 for alcohol-incombination, 83.7 for crack, 73.6 for marijuana, 76.4

for cocaine, and 62.7 for alcohol-only. A higher proportion of female treatment admissions smoked cigarettes compared with their male counterparts within each drug type listed above. Proportionately more females than males also smoked cigarettes within each racial/ethnic group.

Smoking has become increasingly less popular in the general public, with only 20 percent of adults and 38 percent of high school students in 1998 smoking cigarettes in the 30 days prior to the survey date. By comparison, only 7.2 percent of students in grades 7 and 8 in 2001 smoked cigarettes in the 30 days prior to the survey, while 12.5 smoked cigarettes in 1999. However, the recent anti-smoking effort in the State didn't seem to have impacted the substance abusing community in treatment.

INFECTIOUS DISEASES RELATED TO DRUG ABUSE

The drug-abusing population in Newark PMSA (and the State) and those living with HIV/AIDS exhibit similar characteristics. There were 11,592 people living with HIV/AIDS in Newark PMSA as of June 30, 2002. Of these, 11,376 were adults/adolescents and 4,619 (39.8 percent) were females; 36.8 percent of the adult/adolescent cases were IDUs (exhibit 7). Only 1 percent were younger than 20 and 23 percent were older than 49. Over 70 percent (70.1 percent) of people with HIV/AIDS were 30–49 years old.

The population living with HIV/AIDS in Newark PMSA was overwhelmingly Black (72 percent), followed by Hispanic (14 percent) and White (12 percent).

Statewide, the number of people living with HIV/AIDS as of June 30, 2002, was 29,767, of which 29,320 were adults; 35.9 percent were females. IDUs, including those who engage in male-to-male sex, accounted for 37.0 percent of statewide adult cases (exhibit 8).

Only 2 percent of statewide cases were younger than 20 years old and 20.2 percent were older than 49 years old. The race/ethnicity distribution of people living with HIV/AIDS statewide is also skewed towards Blacks who accounted for 56.0 percent of all cases, and Hispanics who accounted for 20.4 percent.

A large proportion of females (35.7 percent in Newark PMSA and 36.4 in the State) were infected through heterosexual contact compared with males (11.7 percent and 10.1 percent in Newark PMSA and the State, respectively).

The continued increase in heroin injection by the young (age 25 or younger), the very high level of heroin abuse and heroin-related deaths suggest a possible increase in the prevalence of infectious

diseases. However, no data are yet available to document any rise in the prevalence of infectious diseases.

Exhibit 1. Selected Indicators for Specific Drugs in the Newark PMSA: 1H01-1H02

Drug Use Mentions	Treatment Data (1H01–1H02)	ED Mentions (1H01–1H02)			
Alcohol-in-Combination	Stable	Stable			
Heroin	Stable	Stable			
Cocaine	Stable	Increased			
Marijuana	Stable	Increased			
PCP	Stable	(No Data)			
Methamphetamine	Stable	(No Data)			
Ecstasy (MDMA)	Stable	Stable			
Ketamine	(None)	(No Data)			
Total	Stable	Stable			
Other Trends					
Heroin purity	Decreased between 2000 and 2001				
Heroin price	Stable at \$ 0.33 per milligram pure				
Injection	Increased among 18-25 and 26-34				
Drug-related deaths	Increased (Driven mainly by cocaine, narcotic analgesics and marijuana)
